

# 7. MoveIt scene design

## 7. MoveIt scene design

- 7.1. Start
- 7.2. source code
- 7.3. Scene import and export
  - 7.3.1. Import
  - 7.3.2. Export

This lesson takes MoveIT simulation as an example. If you need to set up the real machine and simulation to be synchronized, please see the lesson [02, MoveIt Precautions and Controlling the Real Machine]. !!! be safe !!!

The effect demonstration is a virtual machine and other main control running conditions (related to the main control performance, depending on the actual situation).

## 7.1. Start

```
#Raspberry Pi 5 master needs to enter docker first, please perform this step
#If running the script into docker fails, please refer to ROS/07, Docker tutorial
~/run_docker.sh
```

Start MoveIT

```
roslaunch arm_moveit_demo x3plus_moveit_demo.launch sim:=true
```

<PI5 needs to open another terminal to enter the same docker container

1. In the above steps, a docker container has been opened. You can open another terminal on the host (car) to view:

```
docker ps -a
```

```
jetson@ubuntu:~$ docker ps -a
CONTAINER ID   IMAGE                                COMMAND                  CREATED        STATUS        PORTS        NAMES
5b698ea10535   yahboomtechnology/ros-foxy:3.3.9   "/bin/bash"            3 days ago    Up 9 hours                ecstatic_lewin
jetson@ubuntu:~$
```

2. Now enter the docker container in the newly opened terminal:

```
docker exec -it 5b698ea10535 /bin/bash
```

```
jetson@ubuntu:~$ docker ps -a
CONTAINER ID   IMAGE                                COMMAND                  CREATED        STATUS        PORTS        NAMES
5b698ea10535   yahboomtechnology/ros-foxy:3.3.9   "/bin/bash"            3 days ago    Up 9 hours                ecstatic_lewin
jetson@ubuntu:~$ docker exec -it 5b698ea10535 /bin/bash
-----
my_robot_type: x3 | my_lidar: a1 | my_camera: astrapro
-----
root@ubuntu:/#
```

After successfully entering the container, you can open countless terminals to enter the container.

Start the scene design node

```
roslaunch arm_moveit_demo 06_set_Scene.py
```

The renderings are as follows

## 7.2, source code

Open the jaws

```
# Simulation
pub_joint = rospy.Publisher("/move_group/fake_controller_joint_states",
JointState, queue_size=1000)
#realmachine
pub_Arm = rospy.Publisher("TargetAngle", ArmJoint, queue_size=1000)
arm_joint = ArmJoint()
arm_joint.id = 6
arm_joint.angle = 180 - 0.55 * 180 / pi
joint_state = JointState()
joint_state.name = ["grip_joint"]
joint_state.position = [-0.58]
for i in range(10):
    pub_joint.publish(joint_state)
    pub_Arm.publish(arm_joint)
    sleep(0.1)
```

Add the robot arm end clamp block

```

p = PoseStamped()
p.header.frame_id = end_effector_link
p.pose.orientation.w = 1
# Add tool
scene.attach_box(end_effector_link, 'tool', p, [0.03, 0.03, 0.03])

```

Add supports

```

table_list = {
    "obj0": [[0.08, 0.01, 0.4], [0.4, -0.1, 0.2]],
    "obj1": [[0.08, 0.01, 0.4], [0.4, 0.1, 0.2]],
    "obj2": [[0.08, 0.22, 0.01], [0.4, 0, 0.4]],
    "obj3": [[0.08, 0.22, 0.01], [0.4, 0, 0.29]],
    "obj4": [[0.08, 0.22, 0.01], [0.4, 0, 0.17]],
}
# add obj
for i in range(len(table_list)):
    add_obj(p, table_list.keys()[i], table_list[table_list.keys()[i]][0],
            table_list[table_list.keys()[i]][1])

```

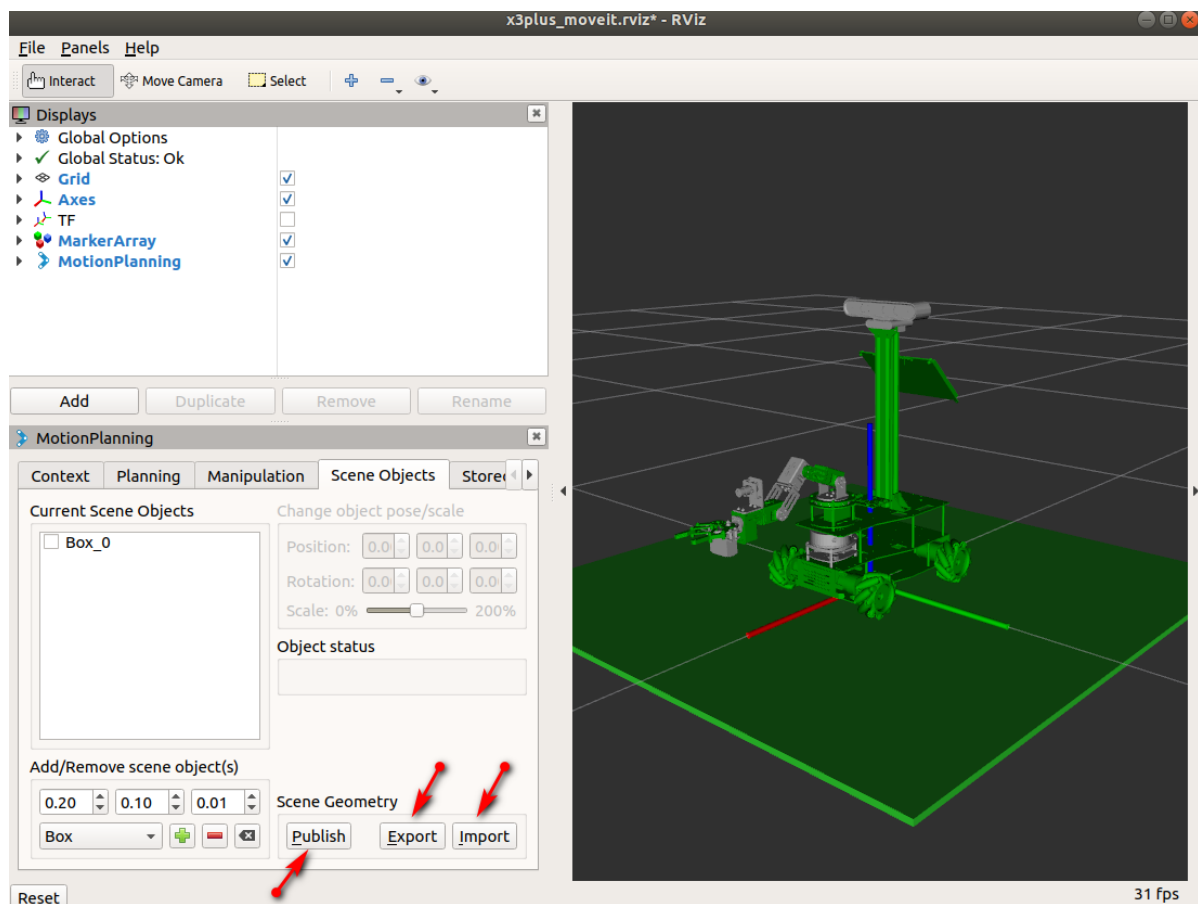

Loop planning between two points

```

i = 0
while i < 5:
    yahboomcar.set_joint_value_target(target_joints1)
    yahboomcar.go()
    yahboomcar.set_joint_value_target(target_joints2)
    yahboomcar.go()
    i += 1
print ("{}th planning!!!".format(i))

```

## 7.3. Scene import and export

### 7.3.1. Import

As shown above, click the [Import] button, select the [arm\_moveit\_demo/scene/floor.scene] file, and confirm it to import.

Be sure to click [Publish], otherwise it will not work.

### 7.3.2. Export

As shown above, click the [Export] button, select the path to be saved, and modify the name to be saved. It will be used for import and release next time.
